

# Thermal core usage challenges in Android

*Wednesday, 22 September 2021 08:35 (20 minutes)*

The Android community has been using thermal core infrastructure for both Tj and Tskin solutions for years, and many thermal DVFS features from various Vendors/OEMs are built upon this, which usually require changes in the thermal governor and framework. However, with GKI introduced, it is now forbidden for OEM to put a custom thermal governor as a module which limits the solution and sometimes leads to sub-optimal code which combines an in-driver governor. In addition, there are many learnings from use of the thermal core infrastructure for both Tskin and Tj solutions together, especially on the way they interact with each other. This talk will describe those problems in more detail and discuss potential solutions and improvements to the current situation.
