XDP Acceleration Using NIC Metadata, Continued

Tuesday, 13 November 2018 16:40 (35 minutes)

This talk is a continuation of the initial XDP HW-based hints work presented at NetDev 2.1 in Seoul, South Korea.

It will start with focus on showcasing new prototypes to allow an XDP program to request required HW-generated metadata hints from a NIC. The talk will show how the hints are generated by the NIC and what are the performance characteristics for various XDP applications. We also want to demonstrate how such a metadata can be helpful for applications that use AF_XDP sockets.

The talk will then discuss planned upstreaming thoughts, and look to generate more discussion around implementation details, programming flows, etc., with the larger audience from the community.

Presenters: WASKIEWICZ, P. J. (Intel); PARIKH, Neerav (Intel)

Session Classification: Networking Track
