## BPF is not a -rt debugging tool

*Tuesday, 13 November 2018 14:20 (25 minutes)*

Xenomai offers a wonderful debugging feature: whenever a realtime thread calls a non-rt safe syscall, SIGXCPU is delivered. That is particularly helpful for users which build their application on top of libraries. Often it is not clear what the side effects of a library call is.

What options are there to implement something similar to SIGXCPU? A simple prototype using BPF showed the limits of BPF (similar experience as Joel describes in “BPFd: Running BCC tools remotely across systems and architectures” <https://lwn.net/Articles/744522/>).

A short brainstorming session with Steven, Julia and Clark showed that there are a few options to achieve the goal. In this session I would like to discuss the options (or even show what has been achieved so far).

Key participants:

- Steven Rostedt
- Julia Cartwright
- Clark Williams
- Sebastian Andrzej Siewior
- Thomas Gleixner

### **I agree to abide by the anti-harassment policy**

Yes
