## Android DTS fstab node requirements

*Wednesday, 14 November 2018 16:00 (15 minutes)*

Android Oreo introduced some device tree bindings that **MUST** be specified for Android to be able to mount core partitions early (before SELinux enforcement) in the boot sequence for Project Treble. This talk is about the plans to get rid of that kernel / device tree dependency.. Instead, have a single global fstab for all and how the device tree fstab is to be deprecated.
