

Clang-tidy and Clang-format

Thursday, 27 August 2020 09:10 (20 minutes)

Clang is a production C compiler (part of LLVM) that provides APIs for C code parsing, formatting, custom compiler warnings, static analysis, etc. This framework has spawned widely used tools like clang-format and clang-tidy. These tools can be easily tailored for particular codebases like the Linux kernel.

This talk shows how to run clang-format, clang-tidy (including writing custom checks), and scan-build to help everyday Linux kernel development, using the kernel support we landed.

Furthermore, we will seek feedback on how we can incorporate these tools into wider kernel dev/CI workflows, as well as what kinds of static analyses we should seek to develop in the future.
